GREENERA UI/UX DESIGN 2025

# A Product Page That Tells You Which Sustainability Claims To Trust

| TIMELINE | ROLE | METHODS | TOOLS |
|---|---|---|---|
| 2025 | End-to-end UI/UX designer (solo) | Product teardown, user interviews, journey mapping, hi-fi prototyping | Figma, FigJam |

## TL;DR

Shoppers who want to buy sustainably can't tell which claims to trust. Product pages stack specs, badges, and marketing claims at the same visual weight, so five minutes of reading leaves you no closer to knowing what matters.

Greenera turns that into one moment. Scan a product, get a Verified Score split into Human Health, Sourcing Impact, and Supply Chain, with plain-language ingredient breakdowns underneath. Where a claim can't be verified yet, the score says so instead of rounding up.

| RESEARCH | DESIGN | STATUS |
|---|---|---|
| Teardown of a live product page, four user interviews, and a six-stage purchase journey map, synthesized into four problem statements and four design goals. | High-fidelity screens for the scan entry point, the At a Glance score, the ingredient breakdown, and the claim verification split. Built solo, end to end. | Concept project. Designed and ready to test, not yet validated with users. The Outcome section says exactly what would prove it. |

## BRIEF

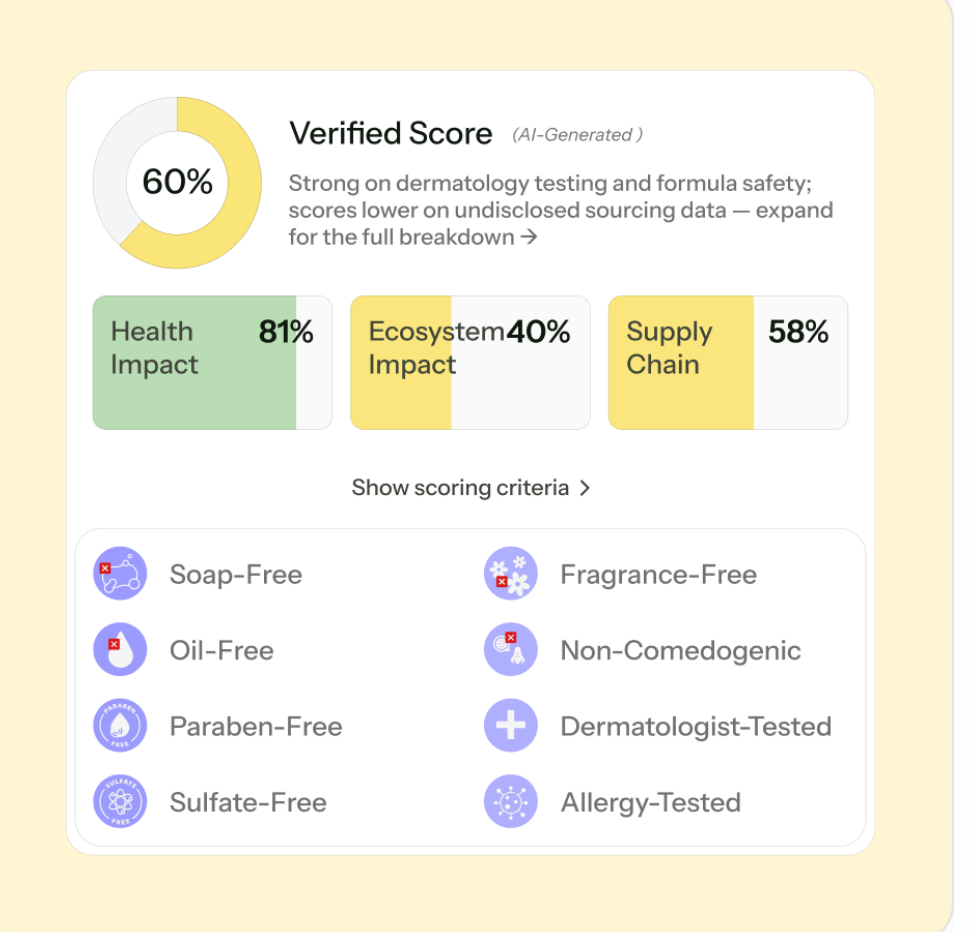
Design an e-commerce experience that makes health- and environment-conscious buying decisions simple and transparent.

## CHALLENGE

How might a product page make sustainability claims verifiable at a glance, instead of handing shoppers a pile of claims and expecting them to check it alone?

## SOLUTION

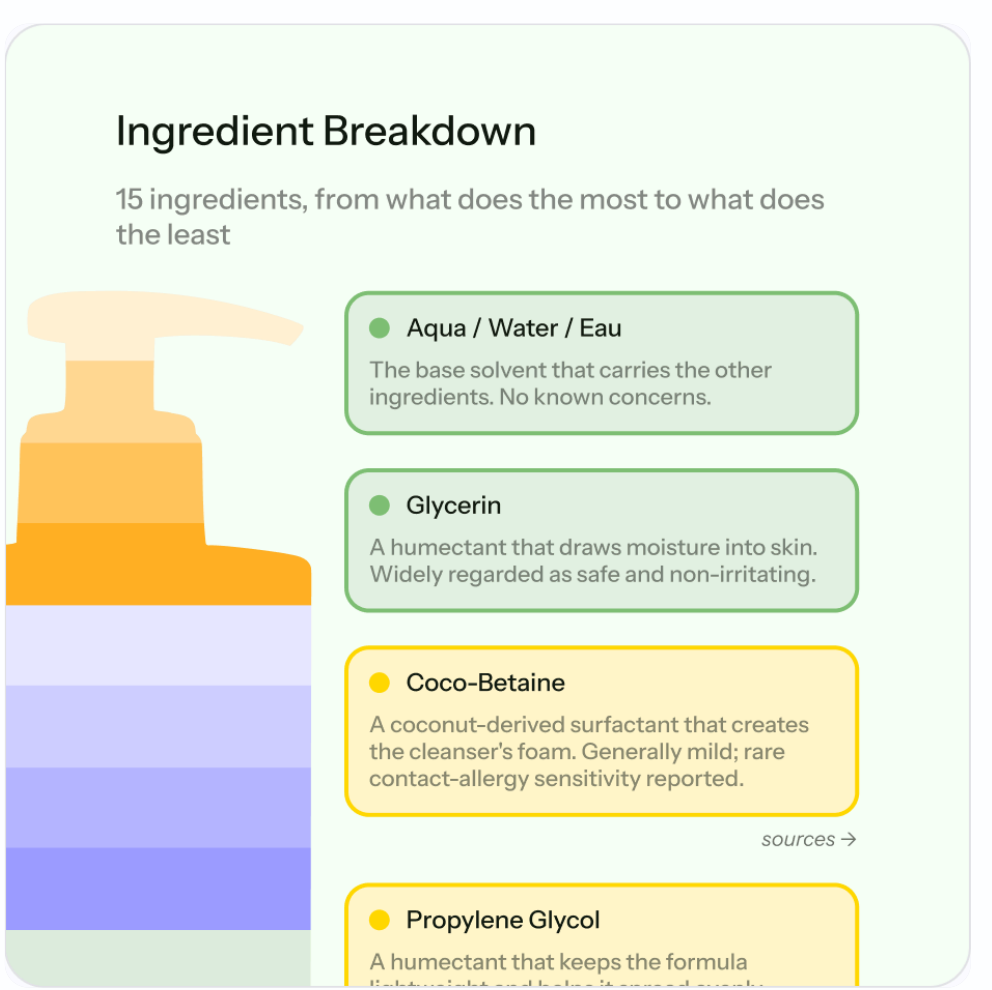
Three screens carry the idea. Here's what each one does.



Verified Score (AI-Generated)
60%
Strong on dermatology testing and formula safety; scores lower on undisclosed sourcing data — expand for the full breakdown →
Health Impact 81% | Ecosystem Impact 40% | Supply Chain 58%
Show scoring criteria >
Soap-Free, Fragrance-Free, Oil-Free, Non-Comedogenic, Paraben-Free, Dermatologist-Tested, Sulfate-Free, Allergy-Tested

### One score, not five scattered signals.

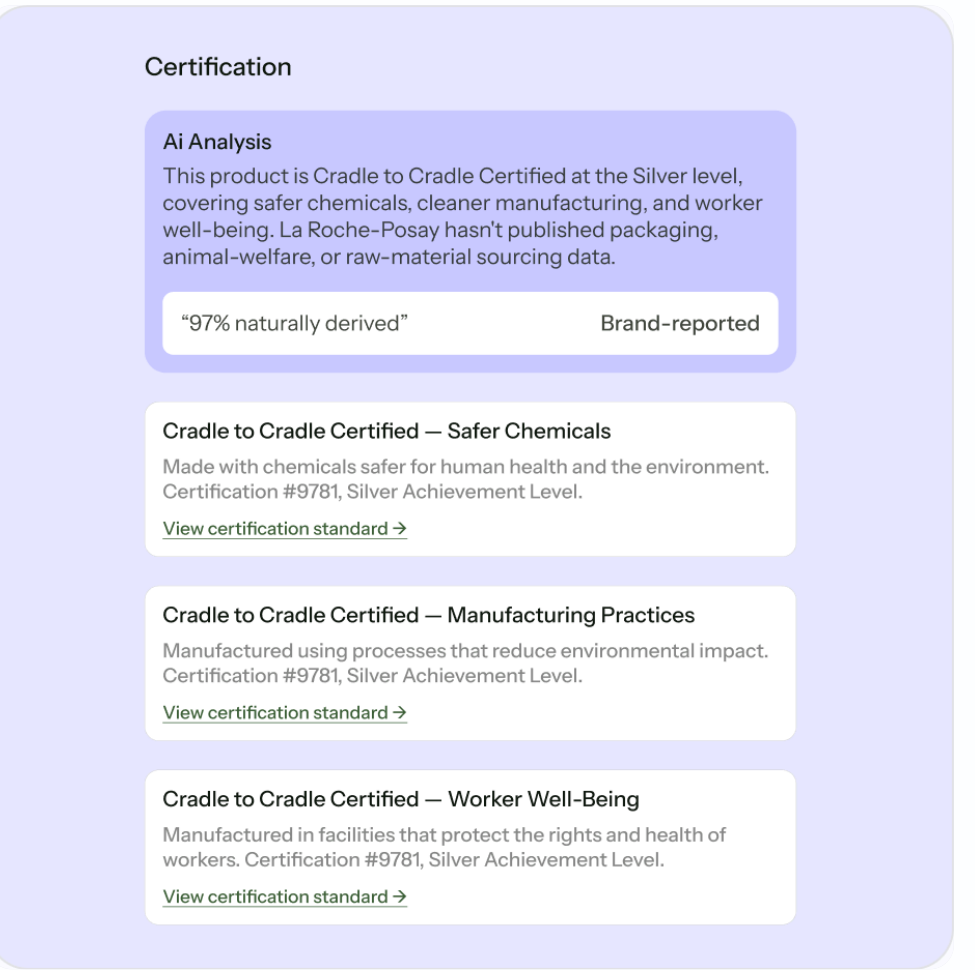
The page leads with a single Verified Score, split into Human Health, Sourcing Impact, and Supply Chain. Shoppers see what to check first instead of guessing.



Ingredient Breakdown
15 ingredients, from what does the most to what does the least
Aqua / Water / Eau — The base solvent that carries the other ingredients. No known concerns.
Glycerin — A humectant that draws moisture into skin. Widely regarded as safe and non-irritating.
Coco-Betaine — A coconut-derived surfactant that creates the cleanser's foam. Generally mild; rare contact-allergy sensitivity reported.
sources →
Propylene Glycol — A humectant that keeps the formula

### Plain-language ingredients, no detour required.

Fifteen ingredients, sorted by concentration, each explained in one sentence, on the page. No jump to Alexa or a separate chat window.



Certification
Ai Analysis
This product is Cradle to Cradle Certified at the Silver level, covering safer chemicals, cleaner manufacturing, and worker well-being. La Roche-Posay hasn't published packaging, animal-welfare, or raw-material sourcing data.
"97% naturally derived" Brand-reported
Cradle to Cradle Certified — Safer Chemicals
Made with chemicals safer for human health and the environment. Certification #9781, Silver Achievement Level.

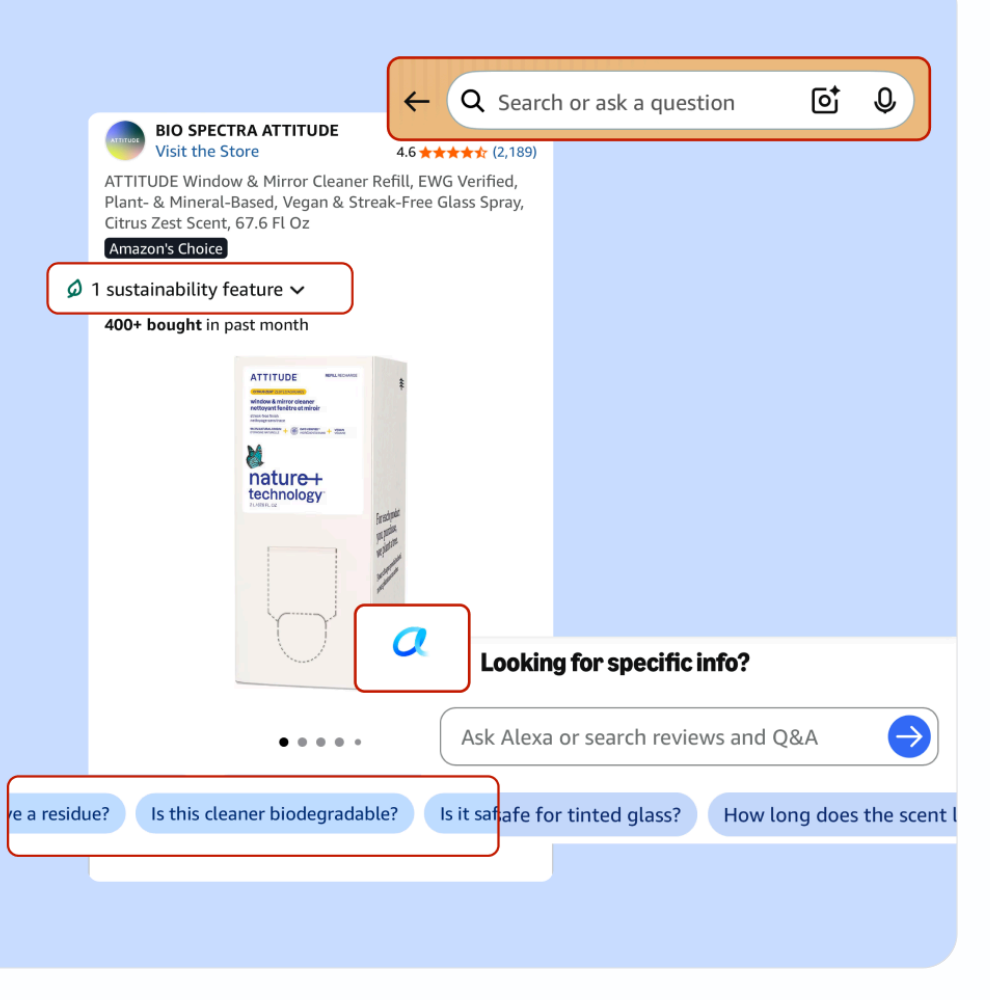
### Brand claims and verified data, kept visibly apart.

Every claim is tagged Brand-reported or AI-analyzed. Shoppers know which one to trust, and why.

## THE PROBLEM

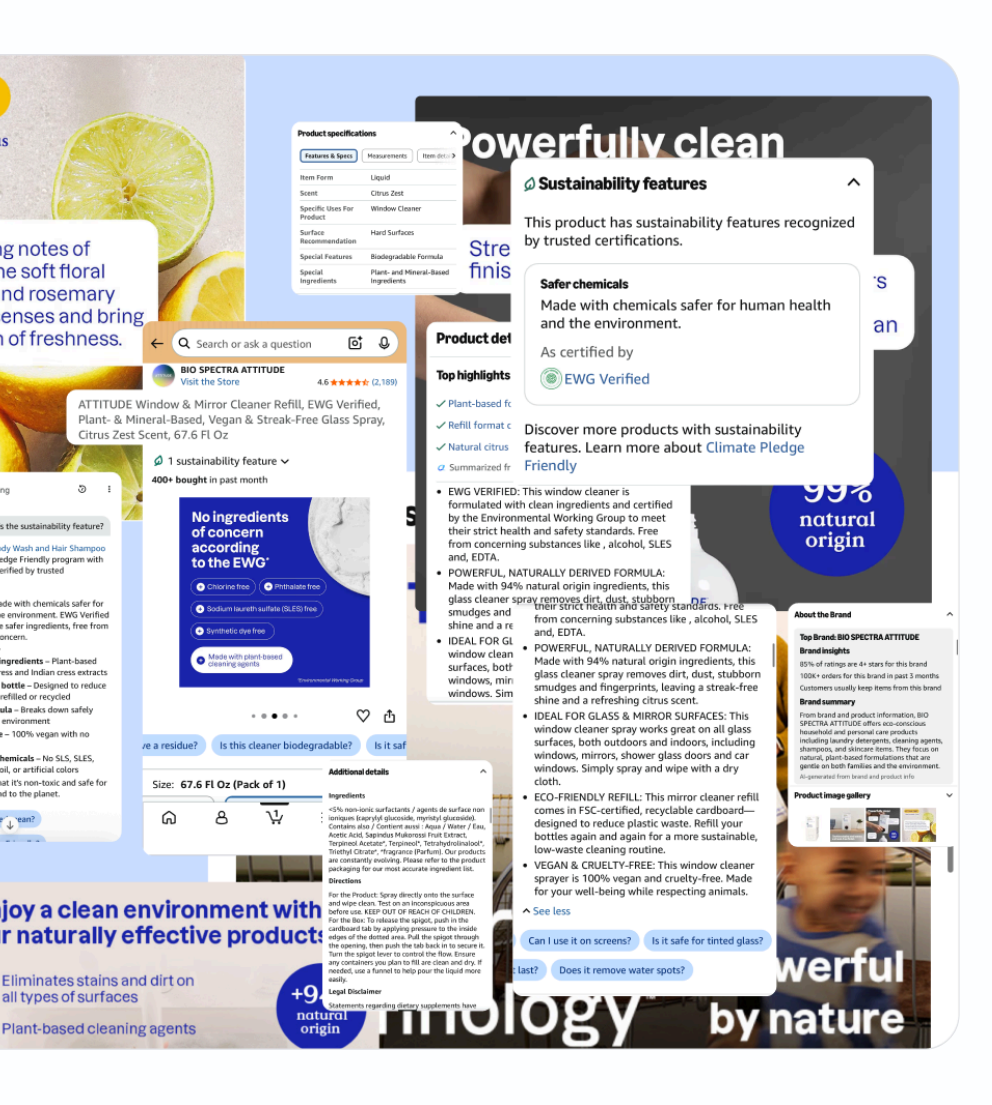
I pulled apart a live product page for a cleaning product and walked it the way a shopper would. Four things broke.



BIO SPECTRA ATTITUDE
Visit the Store
ATTITUDE Window & Mirror Cleaner Refill, EWG Verified, Plant- & Mineral-Based, Vegan & Streak-Free Glass Spray, Citrus Zest Scent, 67.6 Fl Oz
Amazon's Choice
1 sustainability feature
400+ bought in past month
Search or ask a question
Looking for specific info?
Ask Alexa or search reviews and Q&A
Is this cleaner biodegradable? | Is it safe for tinted glass? | How long does the scent

### Every entry point promises a different kind of truth, so none of them earn trust.

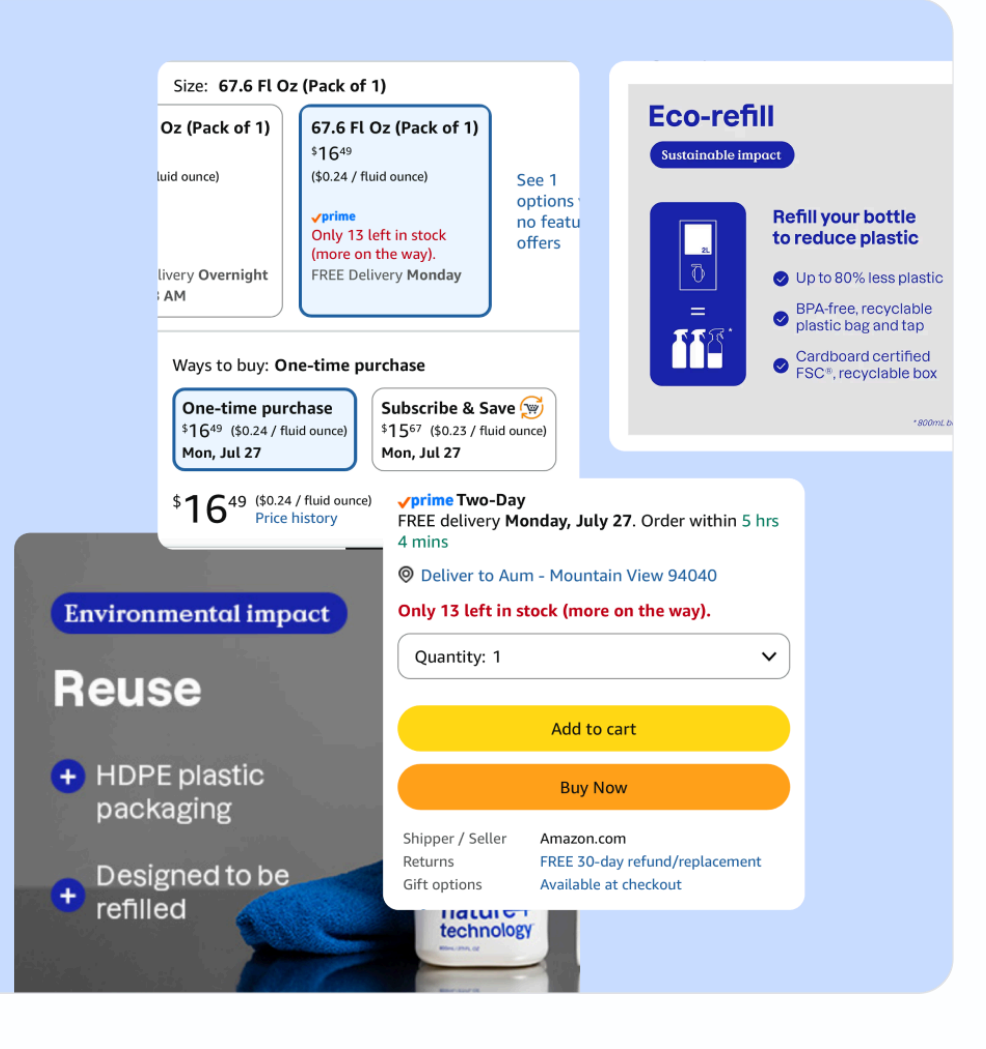
Search bar, question chips, a leaf badge, an Alexa icon. Four paths to the same answer. The badge carries no score or certification behind it, and tapping it exits the page into a chat window.



Powerfully clean
Sustainability features
This product has sustainability features recognized by trusted certifications.
Safer chemicals
EWG Verified
99% natural origin
Enjoy a clean environment with our naturally effective products
by nature

### More information isn't more trust, it's more to verify.

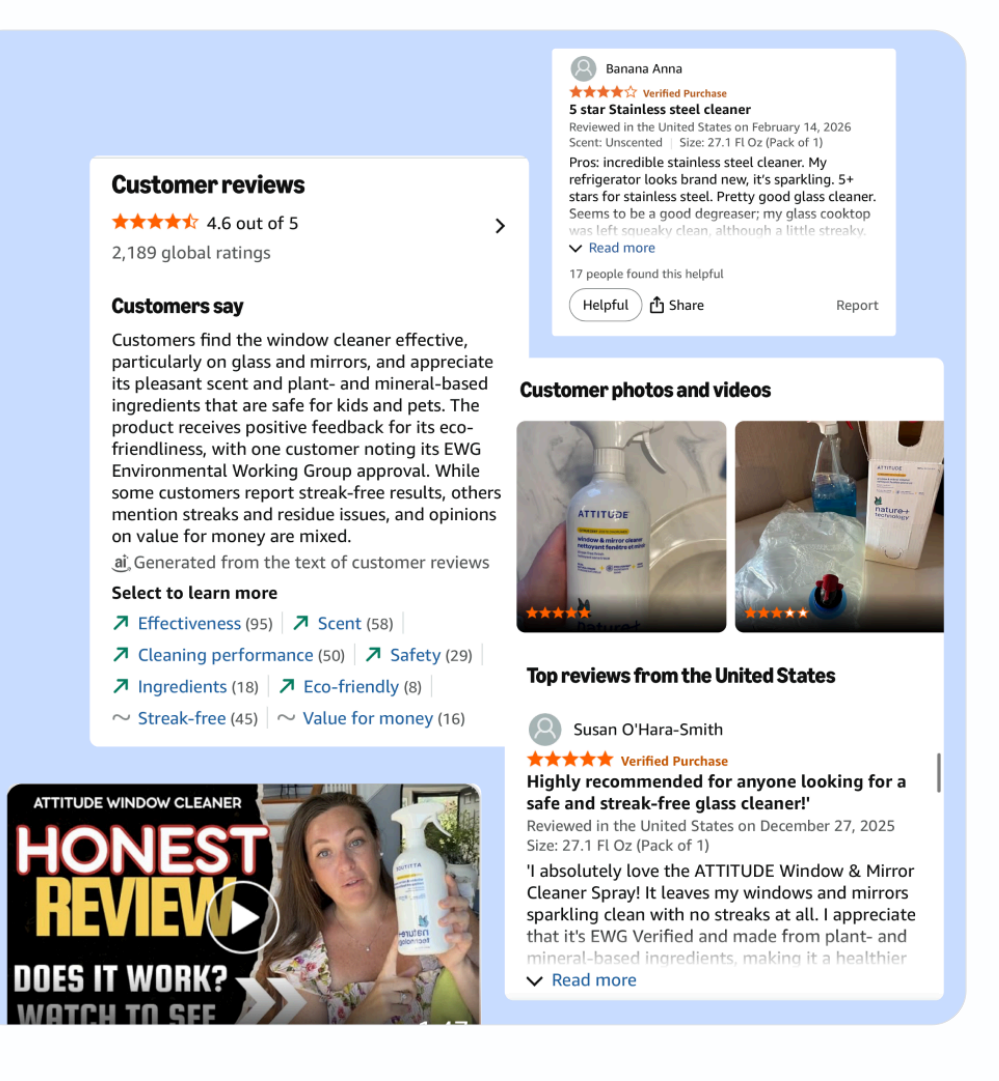
Specs, claims, ingredient callouts, and suggested questions all carry the same visual weight. A shopper scanning for five minutes still can't tell which claim to check first.



Size: 67.6 Fl Oz (Pack of 1)
Only 13 left in stock (more on the way).
Ways to buy: One-time purchase
One-time purchase $16.49 | Subscribe & Save $15.67
Eco-refill
Refill your bottle to reduce plastic
Environmental impact
Reuse
HDPE plastic packaging
Designed to be refilled
Add to cart
Buy Now

### The purchase moment optimizes for urgency, not the habit it claims to support.

One-time purchase and Subscribe & Save look identical, so neither points toward the lower-waste option. "Only 13 left in stock" pushes for speed instead. Refill and impact info sit in a separate card, outside the buy box, so it never enters the decision.



Customer reviews
4.6 out of 5
2,189 global ratings
Customers say
Customers find the window cleaner effective, particularly on glass and mirrors, and appreciate its pleasant scent and plant- and mineral-based ingredients that are safe for kids and pets. The product receives positive feedback for its eco-friendliness, with one customer noting its EWG Environmental Working Group approval. While some customers report streak-free results, others mention streaks and residue issues, and opinions on value for money are mixed.

Top reviews from the United States
Highly recommended for anyone looking for a safe and streak-free glass cleaner!

### Reviews tell you if it worked, not whether the claims are true.

Reviews cover smell and streaks, not whether a "safer chemicals" claim holds up. The page hands shoppers a pile of claims and expects them to verify it alone.

## WHY A SCORE

### The teardown ruled out the badge before I drew anything.

The failure on the live page wasn't a missing signal. It was an unbacked one: a leaf icon with no score, no certification, and no comparison behind it. Adding another badge repeats the problem. A score has to show its parts, so the parts became the design. Three named categories, each traceable to a source.

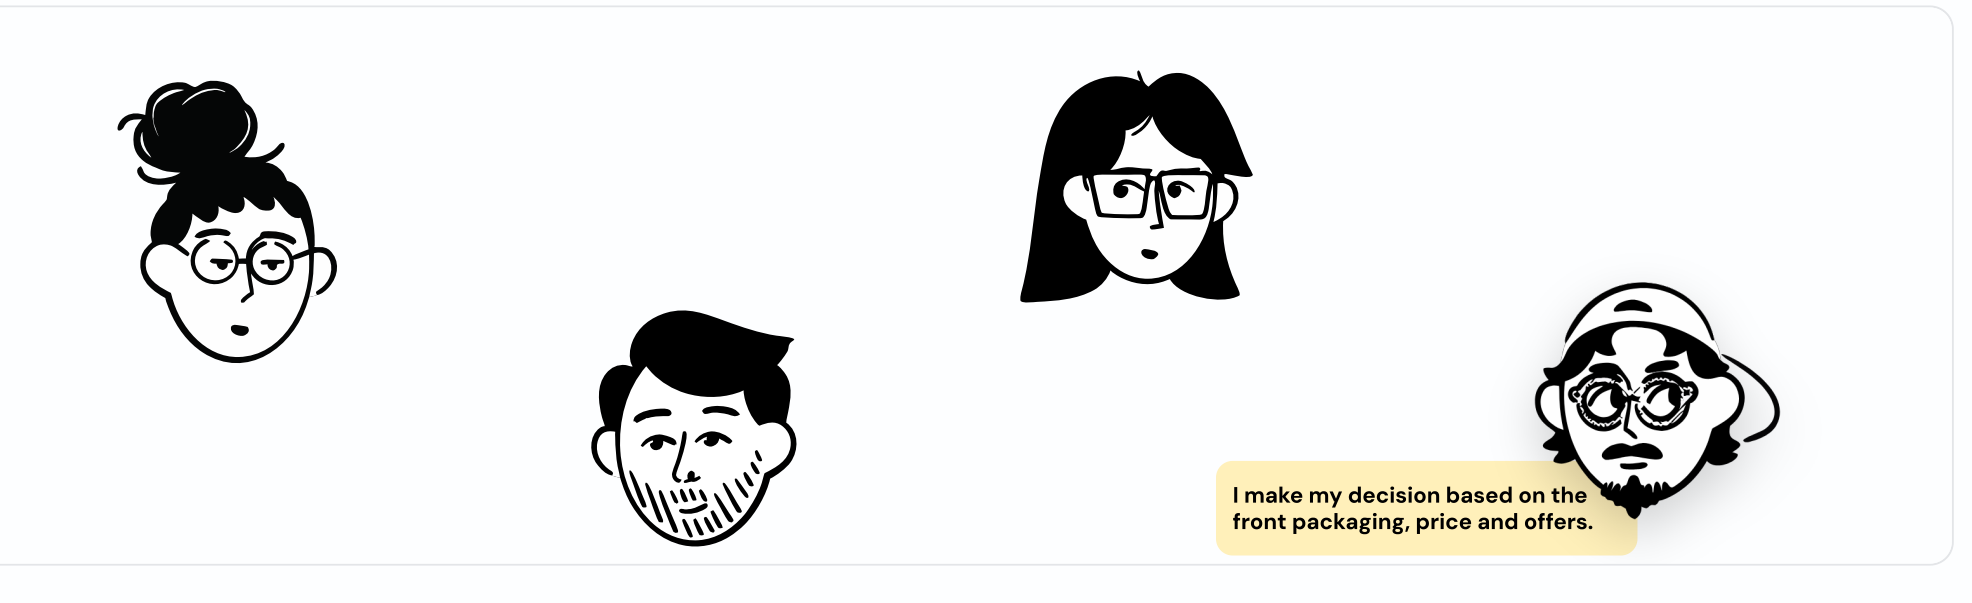
## INITIAL FINDINGS

### But why fix the product page and not search, or checkout?

Because that's where the decision gets made. Mapping six stages, from first discovery to after-sale, showed browsing and product research carrying every trust question. Search sends people to the page. Checkout only confirms what they already decided.

### People aren't unwilling to check. The checking is just too expensive.

Four interviews, across a range of interest in sustainability. Nobody rejected sustainable products. They rejected the effort of verifying them.



I make my decision based on the front packaging, price and offers.

### The trust questions all cluster in one place.

Six stages, mapped with contact points, user actions, and pain points at each. Discovery and browsing raise the questions. Product research is where shoppers try and fail to answer them. That's the stage worth designing for.

| Stage | Discovery | Browsing | Product Research | Purchase | Logistics | After-Sale Services |
|---|---|---|---|---|---|---|
| Contact Points | • Social media<br>• Brand campaigns<br>• Blogs & Reviews<br>• AI - recs<br>• Marketplace recommendations<br>• Search<br>• Ads<br>• Supermarket Aisles | • Brand websites<br>• Ecommerce marketplaces<br>• Search results<br>• Recommendation feeds | • Product pages<br>• Reviews<br>• Comparison sites<br>• Product specifications | • Shopping cart<br>• Checkout<br>• Payment gateway | • Shipment tracking<br>• Courier updates | • Returns portal<br>• Customer support<br>• Loyalty & review prompts |
| User Actions | Deciding what to buy and which brand to trust | Comparing a shortlist of familiar brands | Evaluating one product in depth before buying | Finalizing cart, payment, and delivery choice | Tracking the order and waiting on delivery | Using the product, leaving feedback, or requesting a return |
| User Pain-point | Too much channel noise before trust has a chance to form, so genuine claims get scrolled past | Multiple brands compete for attention, and price and discounts pull judgment away from sustainability | Dense jargon and unverifiable claims force users to leave the app to research elsewhere, which builds no trust | No sense of the delivery's carbon footprint. | No guidance on proper use, disposal, or take-back | Support is generic: refunds, reviews, customer service, nothing tied to sustainability |

## GOAL

### Give the page one visible hierarchy.

Specs, badges, and callouts carry equal weight, so nothing tells the shopper what to check first.

### Explain claims in plain language, in place.

Jargon pushes people off the page to ask Alexa or search elsewhere, which builds no trust.

### Make claims verifiable, not just visible.

Trust currently rests on reviews and influencer content, neither of which can confirm a company's claim.

### Put the sustainable option in the path of the purchase decision.

Refill and impact info sit outside the buy box, so urgency wins by default. This is the one goal I didn't get to. See Reflection.

## THE BUSINESS CASE

### Transparency only differentiates if it's checkable.

Brands already compete on sustainability claims. The teardown shows what that competition currently looks like, which is a leaf badge with nothing behind it. A brand with real data has no way to look different from a brand with a marketing line. Greenera gives the honest one a surface where the difference is visible.

### The revenue model and the score pull against each other.

If brands pay to be scored, the thing judging them has a reason to be generous. I designed against that before I had a name for it. Every claim is tagged Brand-reported or AI-analyzed, and undisclosed categories stay undisclosed instead of rounding up. The label is the safeguard. Whether it holds under commercial pressure is an open question, and it's the first thing I'd stress-test with a real brand.

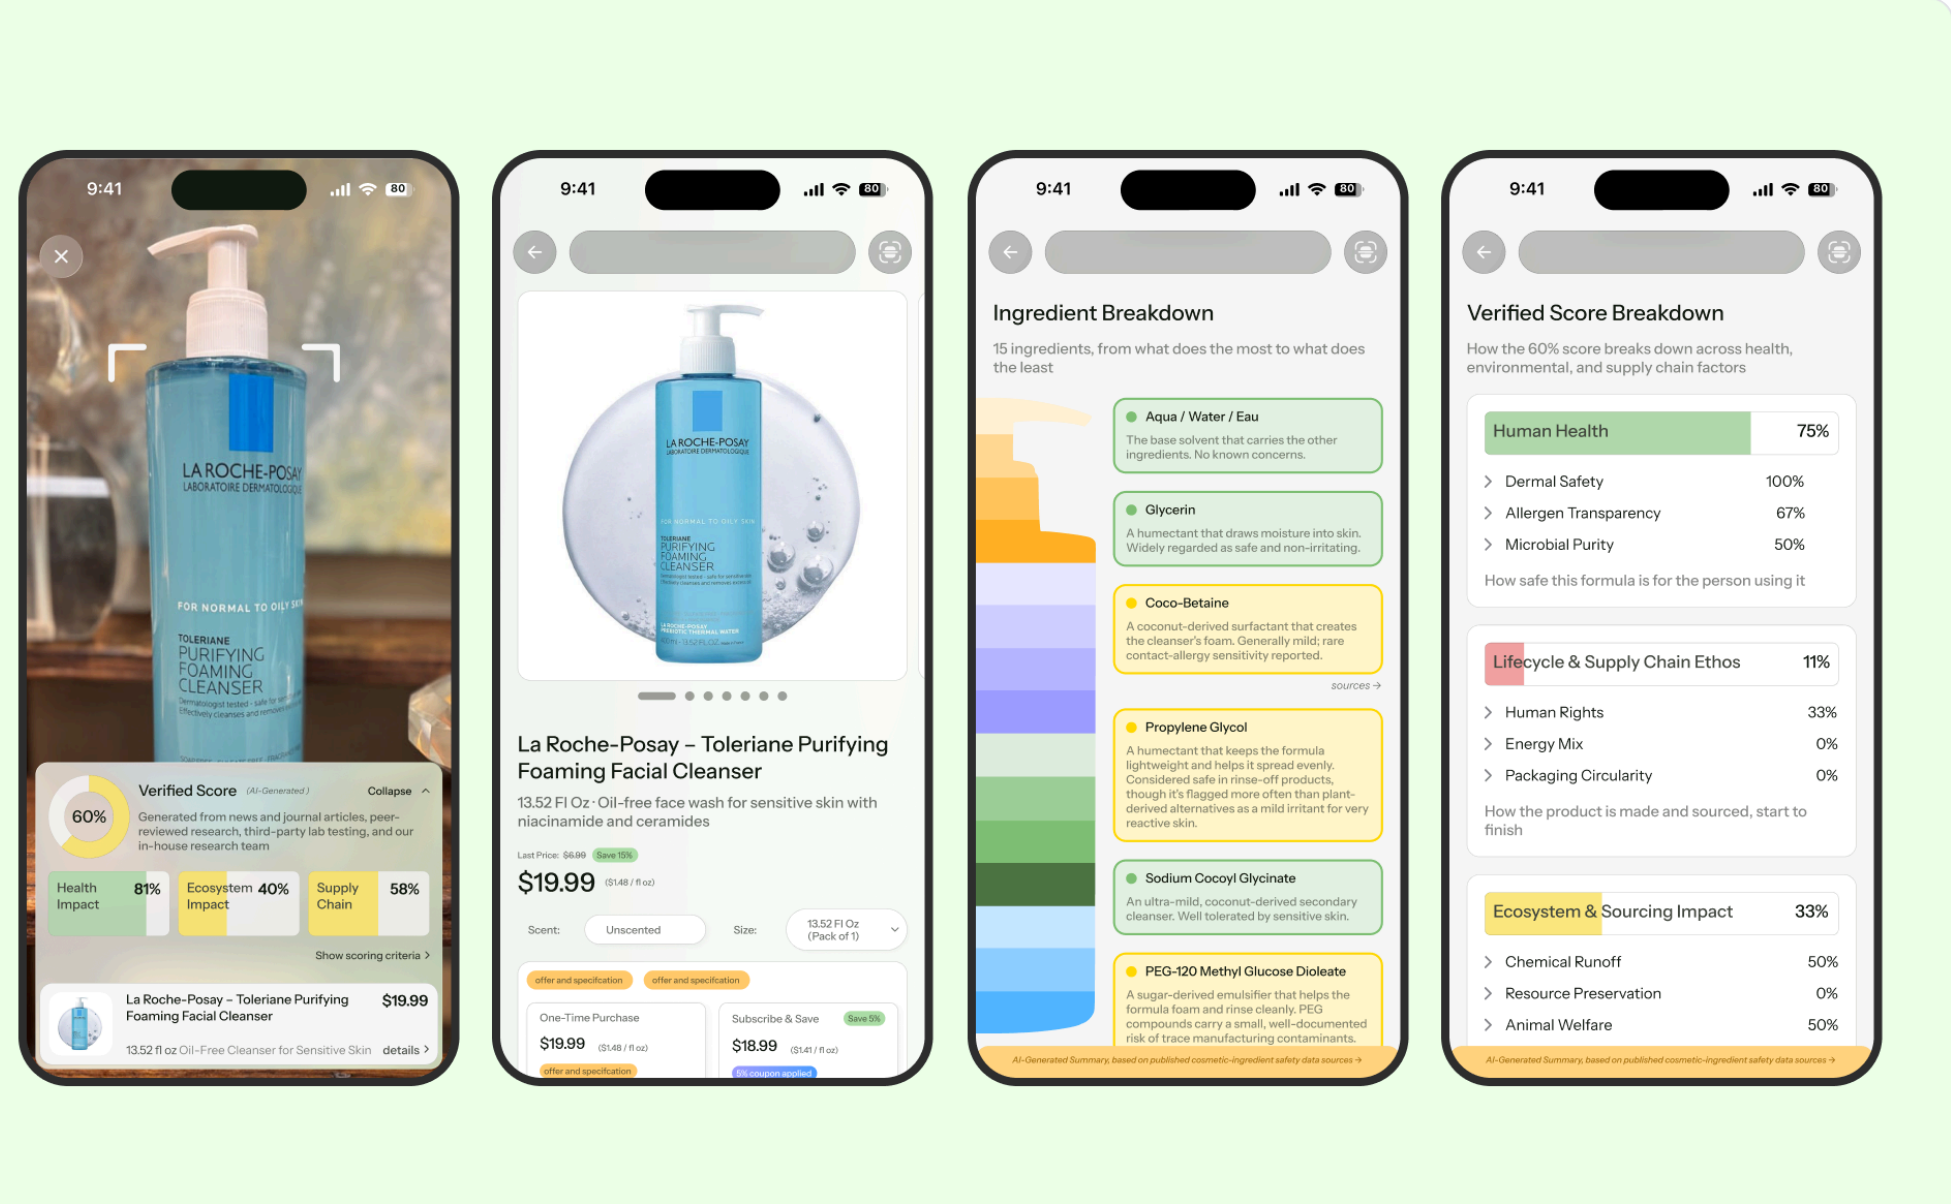
## BEFORE / AFTER

| BEFORE | AFTER |
|---|---|
| Four separate trust signals, none of them scored, and the badge exits the page. | One Verified Score at the top of the page, broken into three named categories. |
| Ingredient names with no explanation, so understanding them means leaving the page. | Fifteen ingredients by concentration, each with a one-sentence explanation in place. |
| Brand claims and third-party certifications look identical, so neither can be checked. | Each claim tagged Brand-reported or AI-analyzed, with the source attached. |

## OUTCOME

### Three of four goals designed, none validated yet.

The scan entry point, the At a Glance score, the ingredient breakdown, and the claim verification split all exist as high-fidelity screens. The fourth goal, putting the sustainable option inside the purchase decision, didn't make this pass.



### What would prove it.

The bet is that a single scored hierarchy changes what shoppers check first. Testing it means putting the original page and this one in front of the same people and watching where they look, in what order, and how long before they give up. Until then it's a design bet, not a result.

## REFLECTION

WHAT I'D CARRY INTO THE NEXT PROJECT

### Map the journey before touching a screen.

Interviews told me people wanted help. The journey map told me where to put it. Without that step I'd have redesigned search, which raises the question but never answers it.

### An unverifiable claim needs its own state, not a zero.

Categories with no disclosed data currently read as 0%, the same as a genuine failure. That quietly undercuts the whole promise of the score. It needs a distinct "Not disclosed" treatment.

### One number, one source of truth.

The At a Glance card and the Verified Score breakdown show different sub-scores for the same product. Two screens, two answers, which is exactly the problem I set out to fix.

### I never tested a simpler format against this one.

A single letter grade would be faster to read and easier to remember than three categories. I didn't prototype one, so I can't claim the score wins. That comparison is the first thing I'd run.

WHAT I'D DO DIFFERENTLY NOW WITH AI

### Pressure-test the score with real data first.

I designed the score with clean sample values. I'd now generate a spread of messy cases — missing fields, partial disclosures, conflicting certifications — and run them through the layout before calling it done.

### Synthesize interviews faster, spend the time on the map.

Four transcripts took longer to code than the journey map that came out of them. I'd cluster them with AI and put the saved hours into more journey stages and more teardowns.
